NEW QUESTION: 3

Which two statements best describe CBWFQ? (Choose two.)

- A. The CBWFQ scheduler provides a guaranteed minimum amount of bandwidth to each class.
- B. The class-default queue only supports WFQ.
- C. CBWFQ services each class queue using a strict priority scheduler.
- D. Inside a class queue, processing is always FIFO, except for the class-default queue.

Answer: A,D

Explanation:

Class-based weighted fair queuing (CBWFQ) extends the standard WFQ functionality to provide support for user-defined traffic classes. For CBWFQ, you define traffic classes based on match criteria including protocols, access control lists (ACLs), and input interfaces. Packets satisfying the match criteria for a class constitute the traffic for that class. A queue is reserved for each class, and traffic belonging to a class is directed to the queue for that class. Once a class has been defined according to its match criteria, you can assign it characteristics. To characterize a class, you assign it bandwidth, weight, and maximum packet limit. The bandwidth assigned to a class is the guaranteed bandwidth delivered to the class during congestion. Within each queue processing is FIFO, except for the class-default queue.

NEW QUESTION: 4

DynamoDB is a fully managed, serverless, NoSQL database service that provides fast and predictable performance with seamless scalability. DynamoDB lets you offload the management of hardware and provisioning to Amazon Web Services (AWS) so you can focus on your application. DynamoDB has the ability to do a scan operation, which reads all the data in a table or a portion of a table. A scan operation can be used to read all the data in a table or a portion of a table. A scan operation can be used to read all the data in a table or a portion of a table. A scan operation can be used to read all the data in a table or a portion of a table.

- A. A scan operation reads all the data in a table or a portion of a table.
- B. A scan operation reads all the data in a table or a portion of a table.
- C. A scan operation reads all the data in a table or a portion of a table.
- D. A scan operation reads all the data in a table or a portion of a table.

Answer: C

Explanation:

Explanation

<https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/bp-query-scan.html> Because a Scan operation reads an entire page (by default, 1 MB), you can reduce the impact of the scan operation by setting a smaller page size. The Scan operation provides a Limit parameter that you can use to set the page size for your request. Each Scan or Query request that has a smaller page size uses fewer read operations and creates a "pause" between each request. For example, if each item is 4 KB and you set the page size to 40 items, then a Query request would consume only 40 strongly consistent read operations or 20 eventually consistent read operations. A larger number of smaller Scan or Query operations would allow your other critical requests to succeed without throttling.
