a good way for you to broaden your horizons as well as improve your skills.

**NEW QUESTION: 1**

You have two assemblies named Assembly1 and Assembly2 that are written in C#. Assembly1 loads Assembly2 by executing the following code.

You create a new project in Microsoft Visual Studio to build a new assembly that will replace Assembly2.

The new assembly has the same name and version as the original Assembly2 assembly.

When you execute the code, Assembly1 cannot load Assembly2.

What should you do to ensure that Assembly1 can load Assembly2?

**A.** Modify the project properties.

Click Sign the assembly and select a new key file.

**B.** Run the sn.exe command to create a new key file.

Run the al.exe command to sign Assembly2 by using the generated key file.

**C.** Modify the project properties. Click Delay sign only.

**D.** Use the sn.exe command to create a new key file.

Set the assembly:AssemblyKeyFileAttribute attribute to the new key file.

**E.** Run the al.exe command to sign Assembly2.

Use the same key file used for the original Assembly2 assembly.

**F.** Add the new Assembly2 assembly to the global assembly cache.

**Answer: E**

Explanation:

**NEW QUESTION: 2**

Click the Exhibit button.

You have a 2-node NetApp cluster. You perform a storage failover and notice that IP address 10.1.100.21 is unreachable while omeganal-01 is rebooting. After omeganal-01 is back online, the IP address becomes reachable again. However, IP address 10.1.100.20 was still reachable during the reboot. The commands shown in the exhibit were executed before the storage failover.

In this scenario, why was IP address 10.1.100.21 unreachable?

**A.** The node management LIFs cannot fail over to other nodes.

**B.** The failover group for 10.1.100.21 is misconfigured.

**C.** The LIF for 10.1.100.21 has an incorrect failover setting.

**D.** The Address Resolution Protocol (ARP) cache needs to be cleared on the upstream switch.

**Answer: A**

## Explanation:

The purpose and the default behavior of a LIF is indicated by the role associated with that LIF. Each LIF is assigned a default failover group and failover policy when you create the LIF. These settings automatically configure the LIF with a list of failover targets from the ports available in the failover group, so you need to understand the relationship between LIF roles and failover groups.

**NEW QUESTION: 3**

An attacker is attempting to telnet into a corporation's system in the DMZ. The attacker doesn't want to get caught and is spoofing his IP address. After numerous tries he remains unsuccessful in connecting to the system. The attacker rechecks that the target system is actually listening on Port 23 and he verifies it with both nmap and hping2. He is still unable to connect to the target system. What could be the reason?

- A. He cannot spoof his IP and successfully use TCP
- B. He is attacking an operating system that does not reply to telnet even when open
- C. The firewall is blocking port 23 to that system
- D. He needs to use an automated tool to telnet in

**Answer: A**
