D. å^¶é™•ä»˜ã••
Answer: D

NEW QUESTION: 3
You are developing a C# application. The application includes a
class named Rate. The following code segment implements the
Rate class:

You define a collection of rates named rateCollection by using
the following code segment:
Collection<Rate> rateCollection = new
Collection<Rate>() ;
The application receives an XML file that contains rate
information in the following format:

You need to parse the XML file and populate the rateCollection
collection with Rate objects.
You have the following code:

Which code segments should you include in Target 1, Target 2,
Target 3 and Target 4 to complete the code?
(To answer, drag the appropriate code segments to the correct
targets in the answer area. Each code segment may be used once,
more than once, or not at all. You may need to drag the split
bar between panes or scroll to view content.)

Answer:
Explanation:

Explanation

Explanation
* Target 1: The element name is rate not Ratesheet.
The Xmlreader readToFollowing reads until the named element is
found.
* Target 2:
The following example gets the value of the first attribute.

```
reader.ReadToFollowing("book");
reader.MoveToFirstAttribute();
string genre = reader.Value;
Console.WriteLine("The genre value: " + genre);
```
* Target 3, Target 4:
The following example displays all attributes on the current node.
C#VB
```
if (reader.HasAttributes) {
Console.WriteLine("Attributes of &lt;" + reader.Name + "&gt;");
while (reader.MoveToNextAttribute()) {
Console.WriteLine(" {0}={1}", reader.Name, reader.Value);
}
// Move the reader back to the element node.
reader.MoveToElement();
}
```
The XmlReader.MoveToElement method moves to the element that contains the current attribute node.
