NEW QUESTION: 3

There is a company website that is going to be launched in the coming weeks. There is a probability that the traffic will be quite high in the first couple of weeks. In the event of a load failure, how can you set up DNS failover to a static website? Choose the correct answer from the options given below.

- A. Duplicate the exact application architecture in another region and configure DNS weight-based routing.
- B. Enable failover to an on-premise data center to the application hosted there.
- C. Use Route 53 with the failover option to failover to a static S3 website bucket or CloudFront distribution.
- D. Add more servers in case the application fails.

Answer: C

Explanation:

Explanation
Amazon Route 53 health checks monitor the health and performance of your web applications, web servers, and other resources.
If you have multiple resources that perform the same function, you can configure DNS failover so that Amazon Route 53 will route your traffic from an unhealthy resource to a healthy resource. For example, if you have two web servers and one web server becomes unhealthy, Amazon Route 53 can route traffic to the other web server. So you can route traffic to a website hosted on S3 or to a CloudFront distribution.
For more information on DNS failover using Route 53, please
