Answer: C

NEW QUESTION: 2

A server with a statically assigned IP address is attached to a switch that is provisioned for DHCP snooping. For more protection against malicious attacks, the network team is considering enabling dynamic ARP inspection alongside DHCP snooping.

Which solution ensures that the server maintains network reachability in the future?

- A. Disable DHCP snooping information option.
- B. Verify the source MAC address of all untrusted interfaces with `ip dhcp snooping verify mac-address` command.
- C. Configure a static DHCP snooping binding entry on the switch.
- D. Trust the interface that is connected to the server with the `ip dhcp snooping trust` command.

Answer: C

Explanation:

Explanation:

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

Intercepts all ARP requests and responses on untrusted ports

Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating

the local ARP cache or before forwarding the packet to the appropriate destination.

Drops invalid ARP packets

Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by

loading the data into the analytical data store.
Litware wants to remove transient data from Data Lake Storage once the data is no longer in use. Files that have a modified date that is older than 14 days must be removed.
