NEW QUESTION: 2

Your company is an online retailer that can have more than 100 million orders during a 24-hour period, 95 percent of which are placed between 16:30 and 17:00. All the orders are in US dollars. The current product line contains the following three item categories:

- * Games with 15,123 items
- * Books with 35,312 items
- * Pens with 6,234 items

You are designing an Azure Cosmos DB data solution for a collection named Orders Collection. The following documents is

a typical order in Orders Collection.

Order Collection is expected to have a balanced read/write-intensive workload.

Which partition key provides the most efficient throughput?

- A. Item/Category
- B. OrderTime
- C. Item/id
- D. Item/Currency

Answer: A

Explanation:

Explanation

Choose a partition key that has a wide range of values and access patterns that are evenly spread across logical partitions. This helps spread the data and the activity in your container across the set of logical partitions, so that resources for data storage and throughput can be distributed across the logical partitions.

Choose a partition key that spreads the workload evenly across all partitions and evenly over time. Your choice of partition key should balance the need for efficient partition queries and transactions against the goal of distributing items across multiple partitions to achieve scalability.

Candidates for partition keys might include properties that appear frequently as a filter in your queries. Queries can be efficiently routed by including the partition key in the filter predicate.

NEW QUESTION: 3

- A. Option D
- B. Option A
- C. Option B
- D. Option C

Answer: A

Explanation:

Topic 6, Coho Winery

Overview

You are a database developer for a company named Coho Winery.

Coho Winery has an office in London.

Coho Winery has an application that is used to process purchase orders from customers and retailers in 10 different countries.

The application uses a web front end to process orders from the Internet. The web front end adds orders to a database named

Sales. The Sales database is managed by a server named Server1.

An empty copy of the Sales database is created on a server

named Server2 in the London office. The database will store

sales data for customers in Europe.

A new version of the application is being developed. In the new version, orders will be placed either by using the existing web front end or by loading an XML file.

Once a week, you receive two files that contain the purchase orders and the order details of orders from offshore facilities. You run the `usp_ImportOrders` stored procedure and the `usp_ImportOrderDetails` stored procedure to copy the offshore facility orders to the Sales database.

The Sales database contains a table named `Orders` that has more than 20 million rows.

Database Definitions Database and Tables

The following scripts are used to create the database and its tables:

Stored Procedures

The following are the definitions of the stored procedures used in the database:

Indexes

The following indexes are part of the Sales database:

Data Import

The XML files will contain the list of items in each order. Each retailer will have its own XML schema and will be able to use different types of encoding. Each XML schema will use a default namespace. The default namespaces are not guaranteed to be unique.

For testing purposes, you receive an XSD file from a customer. For testing purposes, you also create an XML schema collection named `ValidateOrder`. `ValidateOrder` contains schemas for all of the retailers.

The new version of the application must validate the XML file, parse the data, and store the parsed data along with the original XML file in the database. The original XML file must be stored without losing any data.

Reported Issues

Performance Issues

You notice the following for the `usp_GetOrdersAndItems` stored procedure:

The stored procedure takes a long time to complete.

Less than two percent of the rows in the `Orders` table are retrieved by

`usp_GetOrdersAndItems`.

A full table scan runs when the stored procedure executes.

The amount of disk space used and the amount of time required to insert data are

very high.

You notice that the `usp_GetOrdersByProduct` stored procedure uses a table scan when the stored procedure is executed.

Page Split Issues

Updates to the `Orders` table cause excessive page splits on the `IX_Orders_ShipDate` index.

Requirements Site Requirements

Users located in North America must be able to view sales data for customers in North America and Europe in a single report. The solution must minimize the amount of traffic over the WAN link between the offices.

-- --

Bulk Insert Requirements

The usp_ImportOrderDetails stored procedure takes more than 10 minutes to complete. The stored procedure runs daily. If the stored procedure fails, you must ensure that the stored procedure restarts from the last successful set of rows.

Index Monitoring Requirements

The usage of indexes in the Sales database must be monitored continuously. Monitored data must be maintained if a server restarts. The monitoring solution must minimize the usage of memory resources and processing resources.

NEW QUESTION: 4

A technical specialist is working with a customer on a Boot from SAN project after migrating data from DASD to an IBM SAN. The customer is concerned about hardware system downtime after the migration.

Which of the following steps are necessary to handle bringing a host back online to a Boot from SAN state?

- A.** The system administrator needs to swap only the hardware and reconfigure switch zoning and host-port definitions on the storage server.
- B.** The system administrator needs to swap only the hardware and cabling plus configure switch zoning and host-port definitions on the storage server
- C.** The system administrator needs to swap only the hardware and reconfigure the UEFI Boot Order, the HBA's BIOS and host-port definitions on the storage server.
- D.** The system administrator needs to swap only the hardware and reconfigure the UEFI Boot Order, the HBA's BIOS, switch zoning, and host-port definitions on the storage server.

Answer: D
