An administrator is troubleshooting a user's intermittent wireless connectivity issue. Other users across the hallway can connect and use the wireless network properly. Upon inspection of the connection details, the administrator finds the following:

Which of the following is MOST likely the cause of the poor wireless connection?

- A. Latency
- B. Channel overlap
- C. Incorrect antenna type
- D. Overcapacity

**Answer: C**

**NEW QUESTION: 3**

Which scenario does NOT require intraquery parallelism?

- A. The addition of a primary key constraint to an empty column-organized table.
- B. A DML operation that references a populated column-organized table.
- C. The execution of the LOAD command against an empty column-organized table.
- D. The execution of the RUNSTATS command against a populated column-organized table.

**Answer: A**

**NEW QUESTION: 4**

Your network contains an Active Directory domain named contoso.com. The domain contains a main office and a branch office. An Active Directory site exists for each office. All domain controllers run Windows Server 2012. The domain contains two domain controllers. The domain controllers are configured as shown in the following table.

You add the DNS Server server role to DC2.

You discover that the contoso.com DNS zone fails to replicate to DC2.

You verify that the domain, schema, and configuration naming contexts replicate from DC1 to DC2.

You need to ensure that DC2 replicates the contoso.com zone by using Active Directory replication.

Which tool should you use?

- A. Ntdsutil
- B. DNS Manager
- C. Active Directory Users and Computers
- D. Active Directory Sites and Services

**Answer: B**

Explanation:

You can manually initiate replication using DNS Manager. Note: You can use DNS Manager, the DNS snap-in in Microsoft Management Console (MMC), to manage the local Domain Name System (DNS) server as well as remote DNS servers. Using DNS Manager or a command line, you can start, stop, or pause a DNS server. You can also pause and restart individual zones that

are hosted by the server.

Incorrect: Not A: Ntdsutil.exe is a command-line tool that provides management facilities for Active Directory Domain Services (AD DS) and Active Directory Lightweight Directory Services (AD LDS). You can use the ntdsutil commands to perform database maintenance of AD DS, manage and control single master operations, and remove metadata left behind by domain controllers that were removed from the network without being properly uninstalled. This tool is intended for use by experienced administrators.
