Answer: C

NEW QUESTION: 2

You need to create a stored procedure that meets the following requirements:

*Produces a warning if the credit limit parameter is greater than 7,000

*Propagates all unexpected errors to the calling process

How should you complete the Transact-SQL statement? To answer, drag the appropriate Transact-SQL segments to the correct locations. Each Transact-SQL segments may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Answer:

Explanation:

Explanation

Box 1: THROW 51000, 'Warning: Credit limit is over 7,000!',1
THROW raises an exception and transfers execution to a CATCH block of a TRY...CATCH construct in SQL Server.

THROW syntax:

```
THROW [ { error_number | @local_variable },  
{ message | @local_variable },  
{ state | @local_variable } ]  
[ ; ]
```

Box 2: RAISERROR (@ErrorMessage, 16,1)

RAISERROR generates an error message and initiates error processing for the session. RAISERROR can either reference a user-defined message stored in the sys.messages catalog view or build a message dynamically. The message is returned as a server error message to the calling application or to an associated CATCH block of a TRY...CATCH construct. New applications should use THROW instead.

Severity levels from 0 through 18 can be specified by any user. Severity levels from 19 through 25 can only be specified by members of the sysadmin fixed server role or users with ALTER TRACE permissions. For severity levels from 19 through 25, the WITH LOG option is required.

On Severity level 16. Using THROW to raise an exception

The following example shows how to use the THROW statement to raise an exception.

Transact-SQL

```
THROW 51000, 'The record does not exist.', 1;
```

Here is the result set.

Msg 51000, Level 16, State 1, Line 1

The record does not exist.

Note: RAISERROR syntax:

```
RAISERROR ( { msg_id | msg_str | @local_variable }  
{ ,severity ,state }  
[ ,argument [ ,...n ] ] )  
[ WITH option [ ,...n ] ]
```

Note: The ERROR_MESSAGE function returns the message text of the error that caused the CATCH block of a TRY...CATCH construct to be run.

NEW QUESTION: 3

Which of the following is an IS auditor's BEST recommendation for mitigating risk associated with rapid expansion of hosts within a virtual environment?

- A. Limit access to the hypervisor operating system (OS) and administration console
- B. Consider using a third-party service provider to share the virtual machine (VM) risk
- C. Ensure quick access to updated images of a guest operating system for fast recovery
- D. Implement policies and processes to control virtual machine (VM) lifecycle management

Answer: A

NEW QUESTION: 4

Given:

What is the result?

- A. Compilation fails
- B. 0 1 2 0 1 2 0 1 2
- C. 0 1 2
- D. 0

Answer: C

Explanation:

table.length is 3. So the do-while loop will run 3 times with ii=0, ii=1 and ii=2.

The second while statement will break the do-loop when ii = 3.

Note: The Java programming language provides a do-while statement, which can be expressed as follows:

```
do {  
statement(s)  
} while (expression);
```
