**NEW QUESTION: 3**

Of the following pieces of digital evidence, which would be collected FIRST from a live system involved in an incident?

- A.** Media in the CDrom drive
- B.** Directory listing of system files
- C.** Event logs from a central repository
- D.** Swap space and page files

**Answer: D**

Explanation:

Explanation/Reference:

Explanation: Best practices suggest that live response should follow the order of volatility, which means that you want to collect data which is changing the most rapidly. The order of volatility is:

- Memory
- Swap or page file
- Network status and current / recent network connections
- Running processes
- Open files

**NEW QUESTION: 4**

You have a Windows Preinstallation Environment (Windows PE) image.

You need to ensure that when a client computer starts from the Windows PE image, the Net time command is run to synchronize the computer's clock to the clock of a deployment server. What are three possible ways to achieve this goal? (Each correct answer presents a complete solution. Choose three.)

- A. Create a file named Unattend.xml.
- B. Modify Startnet.cmd.
- C. Modify Winpeshl.ini.
- D. Create a script and add the script to Winpe-scripting.cab.
- E. Create a file named Sysprep.inf.

**Answer: A,B,C**

Explanation:

Explanation/Reference:

B: Add a Customized Script with Winpeshl.ini

You can launch a customized shell application by using a file called Winpeshl.ini. Winpeshl.exe will process the settings in Winpeshl.ini during boot. If you create a customized Winpeshl.ini and require Plug and Play or network support, you must include a call to Wipeinit.exe. Wpeinit.exe specifically installs Plug and Play devices, processes Unattend.xml settings, and loads network resources.

C: Add a Customized Script with Startnet.cmd

You can add customized command-line scripts in Windows PE by using Startnet.cmd. By default, Windows PE includes a Startnet.cmd script located at %SYSTEMROOT%\System32 of your customized Windows PE image. Startnet.cmd currently starts Wpeinit.exe. Wpeinit.exe specifically installs Plug and Play devices, processes Unattend.xml settings, and loads network resources

E:

Add Customizations with Unattend.xml

You can use an answer file with Windows PE to specify various settings and actions. When Windows PE starts, it implicitly looks for a file called Unattend.xml at the root of any bootable device (for example, a USB flash drive or a floppy disk). You can also specify an Unattend.xml file by using Startnet.cmd and Wpeinit.exe.

Note: The following procedure demonstrates how to add a customized script to a Windows PE image offline. Windows PE provides three methods for launching custom scripts:

Winpeshl.ini, Startnet.cmd, and Unattend.xml. The Windows PE default interface is a Command Prompt window. However, you can create a customized Winpeshl.ini file to run your own shell application. You can also create your own version of Startnet.cmd to run a specific set of commands, batch files, or scripts. Unattend.xml is a new answer file format for Windows PE 2.0, which replaces Winbom.ini and Winpeoem.sif.

Reference: Include a Custom Script in a Windows PE Image
